FIG. 4

FIG. 5

It is a well known fact that a person wearing a harness will be able to move more freely and with less effort than a person wearing a standard seat belt. This is because the harness is designed to distribute the weight of the person's body over a larger area, rather than concentrating it on the chest and shoulders. As a result, the person wearing the harness will be able to move more easily and with less strain on their muscles. This is particularly true when the person is sitting in a vehicle, where the harness will help to support their weight and keep them in a more comfortable position. In addition, the harness will also help to protect the person in the event of an accident, by keeping them securely in their seat and preventing them from being thrown around. Overall, the harness is a very useful and effective piece of equipment, and it is well worth the investment.

FIG. 6 is a schematic diagram of a treatment site 50. The treatment site 50 is shown in cross-section. A fluid volume 40 is shown increasing and decreasing. The fluid volume 40 is shown increasing and decreasing. The fluid volume 40 is shown increasing and decreasing.
